

Differential Module

The Differential Module measures the thickness of an object with two sensors. The Diff Module accepts two Baby S48s, Baby S4s, SE or a mix of either. Daisy chain capability let you have an array of thickness measurement sensors with an RS-485 serial link.

Displays several information including:

- Reading from sensor #1, sensor #2 or the differential value
- Dipswitches setting for ID module and operation modes
- Value of module parameter's
- One touch calibration button
